Data Collection and Intelligence

The goal of the CCWD data collection and intelligence efforts is to collect, analyze, and deliver information and intelligence to water managers and leaders so they can make sound decisions to manage the water resources efficiently and effectively within the CCWD.

The intent is to provide objective and accurate projections that guide the water management programs in how best to budget, equip and train staffs, and warn of potential crises. Inspection, monitoring and data collection and analysis support the employment of money, material and know-how across a broad continuum of operations, from disaster prevention and relief, to shaping, protection, and improvement projects and activities.

Key Terminology: Intelligence

Intelligence is the act of using information collection and analysis to provide guidance and direction to assist commanders in their decisions.

Capital Projects

Capital projects seek to address a problem or issue or achieve some larger strategic, operational, or tactical goal through the application of money, authority, and/or staff. Their intent to accomplish this is in support of the sustained production or provision of the beneficial uses of water within the watershed. Improvement projects and activities are conducted to restore, improve, or enhance the physical, chemical, or biological function of a water resource or to address or resolve catalysts, stressors, or factors contributing to other, often larger problems.

To do this the CCWD seeks to combine the condition and tendencies of the land and water resources of an area with the monetary, authority, and staff resources needed to achieve an objective.

The capital project plan (CIP) schedules over \$85103 million in capital investments over the next ten years to make reasonable headway toward achieving federal and state water quality goals. Priority investments are targeted for water quality impairments and flood prevention and minimization.

Seventy percent (70%) of investments are targeted toward water quality. These funds will go to projects involving the restorations, rehabilitations, enhancements, and improvements needed to achieve the 2045 deadline for load reductions under the water quality impairments and approved TMDLs. All capital improvement initiatives (projects, practices, studies, and plans) will be prioritized, targeted, and measurable.

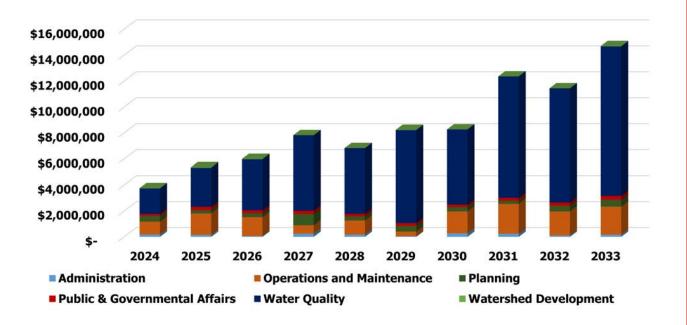

Figure IV. CIP expenditures by program from 2024-2033

Manage Growth and Protect the Resource

Managing growth (development) to prevent actions or circumstances and/or protecting the public health, safety and welfare and the productive, self-renewing relations and critical landscape and hydrologic functions is accomplished largely through the CCWD rule and the state wetland and storm water rules administered by the CCWD. The intent is to protect against natural or man-made changes to the landscape or water resources that are either unmitigated or reduce or prevent biogeochemical functioning.

The purpose of this essential task is to protect the public health and safety as well as the functional ability of the watershed to produce and provide beneficial uses. To do this requires the CCWD to work with landowners and developers to avoidance, minimize and mitigate the effects of land use changes on the structure and function of land and water resources through performance-based regulation of sensitive lands and circumstances affecting ground water, public drainage, water quality, water quantity and wetlands.

Sustainment & Administration

The sustainment or administration of this Comprehensive Plan will rely on three primary factors: funding, materials, and personnel. These factors will be facilitated, coordinated and addressed through an on-going annual planning, programming, budgeting, and execution process. This Comprehensive Plan and any subsequent amendments are administered by the Coon Creek Watershed District Board of Managers.

Key Terminology: Sustainment

Sustainment is the ongoing act of providing the resources required for maintaining and supporting operations of an organization.

Funding

To fund the Capital Improvement Plan (CIP) in this Comprehensive Plan, the CCWD will need in excess of \$85104 million from 2024-2033. Revenue to fund this 2024-2033 CIP is anticipated to come from the following sources: competitive grants, non-competitive grants, intergovernmental sources, and CCWD tax levy. Financing will be done according to the CCWD's financing policy and procedure, which is to seek to finance capital projects first through grant funding. Table III and Figure V show the currently planned revenue schedule for the 2024-2033 CIP.

Table III: Current planned revenue sources for 2024-2033 CIP

| | CCWD | Competitive Grants | Fund Balances | Inter- | Non- | Special Assessment | Total |
|-------|------------------------------|----------------------------|------------------|---|----------------------------|-----------------------|-------------------------------|
| | Levy | Grants | balances | governmental | competitive Grants | Assessment | |
| 2024 | \$2,402,546 | \$500,000 | \$0 | \$708,408 | \$147,050 | \$0 | \$3,758,004 |
| 2025 | \$2,793,835 | \$500,000 | \$0 | \$1,649,743 | \$417,050 | \$0 | \$5,360,629 |

| Total | \$42,783,382 \$55,465,198 | \$5,500,000 \$5,000,000 | \$0 | \$34,197,659 \$41,346,910 | \$2,286,150 \$2,280,500 | \$0 | \$84,767,191 \$104,092,609 |

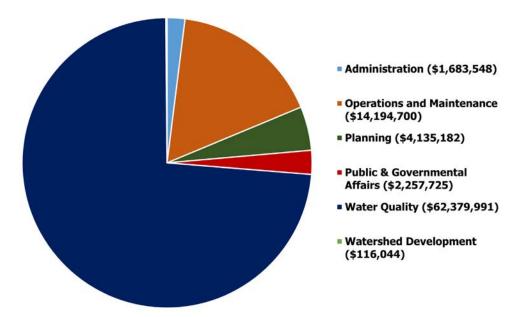

Figure V. CIP program expenditures for 2024-2033 CIP

A large portion of the funding for the 2024-2033 CIP comes from intergovernmental revenue. The projected revenue from this source is the estimated cost-sharing contributions from LGUs in the CCWD that are included in the categorical CCWD TMDL. Revenues were estimated based on the projected cost to achieve the interim CCWD TMDL 2033 pollutant reduction goals. Table VI shows the estimated revenue from intergovernmental sources.

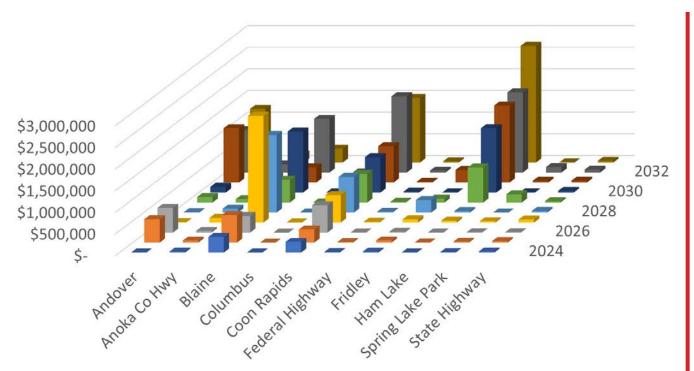

Figure VI. Estimated intergovernmental revenue source by year

Table 1.11 represents the output of the subwatershed prioritization analysis discussed in this section. More detailed subwatershed plans will be conducted for each subwatershed in the CCWD beginning with the highest priority subwatershed first that are not already completed. The Springbrook, Pleasure, and Oak Glen Creek subwatershed plans have already been completed. The subwatershed plans will be revisited approximately every 10 years for a major update.

Table 1.11. Estimated Subwatershed Plan Schedule Based on Priority of Subwatershed.

2.3 Essential Task: Capital Improvement Projects

Capital projects seek to address a problem or issue or achieve some larger strategic, operational, or goal through the application of money, authority, and/or staff. Their intent to accomplish this is in support of the sustained production or provision of the beneficial uses of water resources within the watershed. Improvement projects and activities are conducted to restore, improve, or enhance the physical, chemical, or biological function of a water resource or to address or resolve catalysts, stressors, or factors contributing to other, often larger problems.

The main purpose of improvements is to resolve, eliminate, or neutralize a specific problem or issue. Improvement projects and programs are designed to achieve legislative and program goals and objectives at the least cost. To do this improvement projects combine the condition and tendencies of the land and water resources of an area with the monetary, authority, and staff resources needed to achieve an objective. For this plan, there will be four general types of improvement operations:

- Response, investigate, and resolve
- Direct maintenance, repair, construction, restoration
- Management by opportunity
- · Tracking or pursuing the source

The success of improvement projects and activities is measured by the progress made toward the CCWD's goals and objectives.

2.3.1 Summary of Expenditures

The capital improvement project plan (CIP) schedules over \$85104 million in capital investments over the next ten years to make reasonable headway toward achieving federal and state water quality goals. Priority investments are targeted for.

- Water quality To achieve the 2045 deadline for TMDL compliance.
- Flood prevention and minimization and the operations and maintenance and watershed development actions needed to ensure existing flood elevations and mitigate changes to the landscape.

Seventy percent (70%) of investments are targeted toward water quality. These funds will go to projects involving the restorations, rehabilitations, enhancements, and improvements needed to achieve the 2045 deadline for load reductions under the water quality impairments and approved TMDLs. All capital improvement initiatives (projects, practices, studies, and plans) will be prioritized, targeted, and measurable. Figures 2.04 and 2.05 and Table 2.10 contain summaries of expenditures for the 2024-2033 Capital Improvement Project plan.

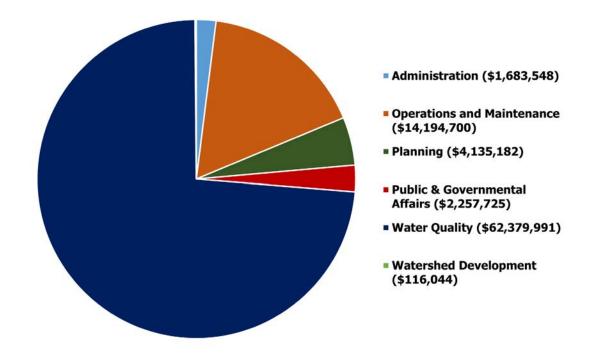

Figure 2.04. CIP Expenditures by Program 2024-2033

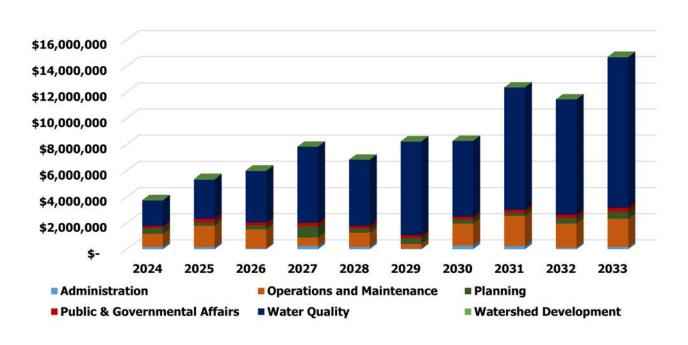

Figure 2.05. CIP Expenditures by program by year

Table 2.10. Summary of capital expenses by program by year

| Year | Administration | Operations & Maintenance | Planning | Public & Gov.Affairs | Water Qual- ity | Watershed Development | Total |
|-------|----------------------------|------------------------------|----------------------------|----------------------------|------------------------------|--------------------------|-------------------------------|
| 2024 | \$182,950 | \$997,610 | \$433,000 | \$153,667 | \$1,975,777 | \$15,000 | \$3,758,004 |

2.3.2 Summary of Revenues

Revenue to fund this 2024-2033 CIP is anticipated to come from the following sources: competitive grants, non-competitive grants, intergovernmental sources, and CCWD tax levy.

Competitive Grants:

The projected revenue from competitive grants is based on the average revenue from these grants over recent years and projected forward assuming the amounts will remain the same. This revenue source has the potential to increase over the next 10 years as more CCWD projects become eligible and additional grant opportunities are identified by the CCWD of LGU partners. This revenue source also has the potential to decrease over the next 10 years as BWSR moves more money from competitive to non-competitive grants.

Non-Competitive Grants:

The projected revenue from non-competitive grants includes the current BWSR Watershed-Based Implementation Funding (WBIF) and federal Nine-Key Element (NKE) plan funding projected forward over 10 years. \$294,100 is allocated every biennium in WBIF to the Coon Creek allocation area and \$270,000 every four years from NKE funding (from 2021 - 2037). The averages of these current grants were spread over each year in the CIP revenue projection. This revenue source has the potential to increase over the next 10 years as BWSR moves more money from competitive to non-competitive grants. WBIF funding amounts can vary with each biennium, and the funding is allocated to all eligible entities within each allocation area. Eligible entities utilize a collaborative decision-making process to identify projects to fund.

Intergovernmental:

The projected revenue from this source is the estimated cost-sharing contributions from LGUs in the CCWD that are included in the categorical CCWD TMDL. Revenues were estimated based

on the projected cost to achieve the interim CCWD TMDL 2033 pollutant reduction goals. Cost estimates to achieve these interim targets were extrapolated from average costs of past CCWD water quality improvement projects implemented from 2009-2023. Average cost estimates were calculated individually for TSS and TP reductions for both TMDL Wasteload Allocations versus Load Allocations. For subwatershed planning areas where specific TMDL implementation projects have not yet been identified, cost estimates for achieving interim TMDL targets were divided evenly across scheduled planning areas and years for each impaired stream. The projected revenue contribution for each LGU was based on the LGU's percentage of land within the subwatersheds in the drainage area of the impaired streams that have a pollutant reduction goal in the watershed. CCWD's percentage of land in this scenario includes all ditches, lakes, and wetlands. The projected revenue for the LGUs currently follows the subwatershed plan implementation schedule (Table 4). The revenue from this source has the potential to vary greatly because the estimated costs to achieve the interim 2033 TMDL pollutant reduction goals are based on multiple large assumptions. See section 1.9 of this Comprehensive Plan for a full discussion of the assumptions made for the cost estimate to meet TMDL pollutant reduction goals.

CCWD Levy:

This revenue source will account for the rest of the revenue required to fund the capital expenditures. The CCWD portion of intergovernmental revenue is also accounted for under this source.

The summaries of these revenue sources are contained in Table 2.12 and Figure 2.06.

Table 2.12. Current Planned Revenue Sources

| | CCWD Levy | Competitive Grants | Fund Balances | Intergovernmental | Non- competitive Grants | Special Assessment | Total |

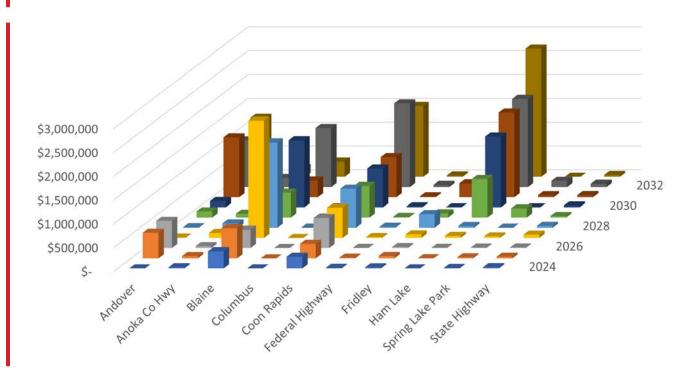

Figure 2.06. Estimated Intergovernmental Revenue Source by Year

Methodology:

For CIP projects related to meeting the CCWD TMDLs, interim load reduction targets were calculated for each pollutant and each impaired stream by subtracting all pollutant reductions achieved through 2023 from the cumulative reductions needed to achieve compliance by the 2045 target year. The balance of needed reductions was then divided across the amount of time remaining until 2045 (21 years) and then multiplied by ten to represent the 10-year plan duration. Cost estimates to achieve these interim targets were extrapolated from average costs of past CCWD water quality improvement projects implemented from 2009-2023. Average cost estimates were calculated individually for mass of TSS and TP reduced for both TMDL Wasteload Allocations versus Load Allocations. For subwatershed planning areas where specific TMDL implementation projects have not yet been identified, these cost estimates for achieving interim TMDL targets were divided evenly across scheduled planning areas and years for each impaired stream. CCWD contribution to Subwatershed Plan TMDL implementation (\$13,788,364) included in CCWD levy revenue.

2.3.3 Method for Prioritization, Targeting, Measurement

All capital improvement initiatives (projects, practices, studies, and plans) will be prioritized, targeted, and measurable. Projects refer to all types of construction-type activities that typically include heavy equipment and land disturbance. Practices refer to non-structural activities such as street sweeping or turf maintenance. Studies examine issues and identify alternatives and potential costs. Plans develop strategies to create a course of action to achieve a goal or set of objectives. Ultimately all initiatives are intended to be prioritized, targeted, and measurable.

Prioritization:

All proposed capital initiatives address one or more of the priority problems, issues, concerns (PICs), or resources identified and detailed in each chapter of this Comprehensive Plan. Priorities are further reflected in the scheduling of projects (the earlier, the higher the current priority).

Priority PICs are discussed in section 2.3 of this Comprehensive Plan.

Priority resources for protection efforts include waters that are currently meeting state water quality standards and have high recreational or ecological value: Crooked Lake, Ham Lake, Lake Netta, Sunrise Lake, and Lake Cenaiko.

Priority resources for restoration efforts include all impaired streams (Coon, Sand, Pleasure, Springbrook), ditches (11, 58, 41-4), the Mississippi River, and contributing tributaries.

Targeting:

All proposed capital initiatives will be targeted. The targeting process optimizes the selection of capital initiatives to address a particular priority resource or PIC by considering the root source of the PIC, the type of initiative, the timing, and location. The CCWD conducts the targeting process in two main ways: planned targeting and opportunistic targeting.

<u>Planned Targeting:</u> This is primarily done through the subwatershed planning process.
The CCWD is in the process of completing subwatershed plans for all 18 subwatersheds
that make up the watershed. Subwatershed plans model existing conditions, map pollutant loading hot spots, identify areas of potential flooding, and identify and prioritize BMPs

- based on cost-effectiveness. Each subwatershed plan identifies capital initiatives that will most cost-effectively address the priority PICs and resources in that subwatershed.
- Opportunistic Targeting: This targeting is conducted outside of the subwatershed planning process. It occurs when priorities or initiatives are identified too late to be included in the budgeting cycle. Examples of opportunistic budgeting are typically new AIS infestations or time-sensitive municipal reconstruction projects that would be candidates for oversizing of BMPs.

Measurement:

Water quality improvement initiatives are to be measured in mass of pollutant reduced or prevented whenever possible. Runoff volumes reduced or treated is also acceptable as these can be translated into mass reductions using established literature values. Stream habitat/ connectivity improvement projects are to be measured using the Minnesota Stream Habitat Assessment tool (MSHA), Minnesota Stream Quantification Tool and Debit Calculator (MNSQT), and CCWD Aquatic Organism Passage (AOP) index. Flood prevention and minimization initiatives can be measured in multiple ways. These include the number of structures removed from the floodplain, the floodplain elevation lowered in a given reach, or storage added in a given reach.

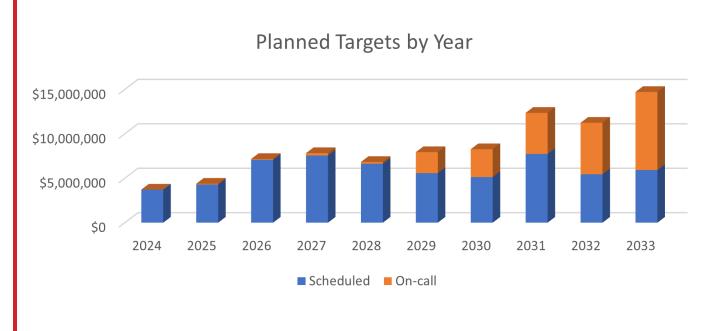

Figure 2.07. Planned/Opportunistic Targets

2.3.4 Evaluation of Capital Projects

The success of capital projects will be evaluated by the progress toward the goals and objectives of the CCWD. The main objective that will be evaluated is progress toward the CCWD's 2045 TMDL goal. Interim TMDL goals for 2033 were calculated by subtracting all pollutant reductions achieved through 2023 from the total reductions required to achieve the Coon Creek TMDL. The balance was distributed evenly across the remaining time until the target year (22 years until 2045) and then multiplied by ten to represent the 10-year plan duration. The Wasteload Alloca-

tions (WLAs) include all regulated stormwater discharges covered under the NPDES MS4 general permit; it is the joint responsibility of all MS4s within the CCWD to achieve categorical WLAs. The Load Allocations (LAs) include unregulated discharges such as runoff from agricultural activities, stream bank and bed erosion, and other non-point sources including natural sources. Although attainment of LAs is required to meet TMDL reductions, implementation strategies are often voluntary in nature and rely on education and incentives to drive behavior change. TMDL loading allocations and interim goals for 2033 are summarized below for each impaired receiving water:

Table 2.13. CCWD TMDL Reduction Goals

| Stressor (unit) | Reductions required by 2045 per CCWD TMDL (WLA+LA=Total Load) | Reductions achieved as of 2023 (WLA+LA) | 2033 interim goals (WLA+LA) | |
|---|---|---|--|--|
| | Coon: 930+824=1754 | 28+2999 | 410+0 | |
| TSS (tons/yr) | Sand: 32+4=36 | 17+642 | 7+0 | |
| | Pleasure: 72+1=73 | 0+101 | 33+0 | |
| | Coon: 7715+6842=14557 | 240+2549 | 3398+1951 | |

| Poor habitat/ Connectivity (index scores) | Improved MSHA, MNSQT, AOP scores | No Change | Improving Scores | |
| Altered hydrology (volume) | Volume/rate reductions for Coon, Sand, and Springbrook Creeks | 1,790,364 cf | Targets determined via subwatershed modeling | |

2.3.5 Capital Project Implementation Cycle

The collaborative targeting cycle is a six-phase iterative process shown in the following figure:

- 1. End State and Legislative Objectives
- 2. Target Development & Prioritization
- 3. Capabilities Analysis
- 4. Collaborator & Board Decision & Agency Assignment
- 5. Project Planning and Execution
- 6. Assessment

Outside of the Annual budgeting and capital improvement planning processes, the process is not time-constrained nor rigidly sequential. Steps may occur concurrently, but it provides an essential framework to describe steps that must be satisfied to conduct Collaborative/collaborative targeting successfully. The deliberate and dynamic nature of the collaborative targeting cycle supports collaborative planning and operations, providing the depth and flexibility required to support implementation of the Comprehensive Plan and Legislative intent as opportunities arise and plans change.

Figure 2.08. Collaborative Targeting Cycle

Phase 1: January-February - End State Evaluation and Legislative Objectives

Understanding the water management end state and the Legislature's intent, centers of gravity, objectives, desired effects, and required tasks developed during operational planning provides the initial impetus for the targeting process. Understanding the State and Federal Agency guidance, and intent is the most important and first activity of Collaborative targeting because they document the set of outcomes relevant to the present situation and set the course for all that follows. Objectives are the basis for developing the desired effects and scope of target development, and are coordinated among strategists, planners, and intelligence analysts for approval by the Administrator and/or Board of Managers.

Phase 2: March-April - Target Development and Prioritization

Target development is the analysis, assessment, and documentation processes to identify and characterize potential targets that, when successfully engaged, support the achievement of the water management objectives. Phase 2 is comprised of three steps:

- Target system analysis.
- Entity-level target development
- Target list management.

Phase 3: May-June - Capabilities Analysis

This phase of the Collaborative targeting cycle involves evaluating all available capabilities against targets 'critical elements to determine the appropriate options available to address the problem or issue while highlighting the best possible solution under given circumstances. Capabilities analysis is comprised of four steps:

- 1. Target vulnerability analysis,
- 2. Capabilities assignment,
- 3. Feasibility assessment
- 4. Effects estimate.

Phase 4: June-July - Collaborator Decision and Agency Assignment

The Agency assignment process integrates previous phases of Collaborative targeting and fuses capabilities analysis with available Agency funding and staff capability and capacity systems. The process of resourcing Initial Priority Target List targets with available Agency or systems and intelligence, inspections and monitoring assets lies at the heart of Agency assignment. This process links theoretical planning to actual operations. Once the Technical Advisory Committee or Subwater Watershed Work Groups have approved the Initial Priority Target List, either entirely or in part, Project specifications are prepared and released to the stakeholders and agencies involved. The decision of water managers in phase 4 is to either approve the draft Initial Priority Target List, or approves a particular way or ways of engaging a particular target or targets.

Phase 5: June-July - Project Planning and Implementation

Upon budget approval, detailed planning must be performed for the execution of projects and activities. During execution, the operational environment changes because of other water resource conditions, circumstances, and management actions. The Collaborative targeting process monitors these changes to allow water managers to use collaborative capabilities to seize and maintain the initiative.

Phase 6: July-August - Targeting Assessment

The targeting assessment phase is a continuous process that assesses the effectiveness of the activities that occurred during the first five phases of the Collaborative targeting cycle. The targeting assessment process helps the water managers and staff determine if the ends, ways, and means of collaborative targeting have resulted in progress toward accomplishing a task, creating an effect, or achieving an objective.

Time Sensitive Target Considerations

The Comprehensive and Local Water Plan objectives and guidance shape the basic procedural framework for components to expedite engagement of Time Sensitive Targets (TSTs). Additionally, the Technical Advisory Committee shares guidance on procedures for coordination, deconfliction, and synchronization among components. Once this guidance is provided, the components establish planned and reactive procedures for engaging the prioritized TSTs.

A critical aspect of successful TST engagement is to understand the level of risk acceptable to the TAC. Items to be considered in the risk assessment include risk to the public, collaborating organizations forces, and individual citizens; possible collateral damage; and the disruption incurred by diverting assets from their deliberately planned projects. <u>Determine Life-cycle & Replacement Costs:</u>

The CCWD will conduct and regularly update a study to estimate the overall costs of all assets &/ or project alternatives to facilitate the selection of alternatives that ensure that portfolio of hard, natural and soft assets that will provide the lowest overall cost of ownership consistent with the needed quality and function.

<u>Subwatershed Analysis and Planning:</u>

The CCWD will develop subwatershed plans for all principle subwatersheds within the CCWD. The objectives are to jointly assess each subwatersheds with the other MS4s and stormwater authorities involved to:

- Identify flooding/drainage and water quality problems, issues and concerns
- Assesses the benefits, problems, and risks to inform decisions related to identification of the optimal drainage system per and designation and management of streams, ditches, lakes, wetlands and shallow ground water.
- Develop a structured set of actions aimed at improving management of storm water and the infrastructure that supports its management. The schedule for subwatershed plan development is as follows:

Table 3.16. CCWD subwatershed planning schedule

| Year | Subwatershed |
|------|--|
| 2024 | Ditch 60 – complete – started in 2023 Stonybrook Creek Sand Creek |

4.1.6 Materials and Services

To accomplish the goals and objectives in this Comprehensive Plan, materials and services are required. These will be managed primarily by the administrative program. Table 4.03 details the anticipated materials and services that will be required to accomplish the goals and objectives of this Comprehensive Plan.

Table 4.03. Administrative Materials and Services Expenditures 2024-2033

Develop, and implement subwatershed plans or other focal area plans:

The subwatershed planning process provides for common understanding of specific program and project level actions for flood mitigation and addressing water quality impairments. Focal area plans could be large developments or redevelopments such as Northtown Mall, the Rural Reserve, or the National Sports Center. These plans serve as key references for and annex to both the Comprehensive Watershed Plan and Local Water Plans. The proposed schedule for subwatershed plan development is as follows:

Table 5.01. Subwatershed planning schedule

| Subwatershed | Estimated Completion of Subwatershed Plan | Andover | АСНБ | Blaine | ccwb | Columbus | Coon Rapids | Fridley | Ham Lake | SLP | State Highway |
