

# Precipitation Current Plan

The average annual precipitation in the watershed during the period of record is approximately 30 inches (UM, 1999). About 70 percent of the annual precipitation (22 inches) falls between April and September. About 6 inches of precipitation occurs during the spring groundwater recharge period of April and May.

Measurable precipitation of 0.01 inches occurs on about 110 days per year, 4 of which have 1 inch or more. Annual amounts of precipitation have ranged from a low of 15.56 inches in 1976 to a high of 43.03 inches in 1991 (UM, 1999). The most precipitation occurring in any month was 9.35 inches in June 1975.

## Amount

| Month         | Monthly Average (in) | 3 years in 10 Less Than (in) | 3 years in 10 More Than (in) |
|---------------|----------------------|------------------------------|------------------------------|
| January       | 1.13                 | 0.75                         | 1.50                         |
| February      | 0.81                 | 0.51                         | 1.05                         |
| March         | 1.73                 | 1.32                         | 2.30                         |
| April         | 2.62                 | 1.82                         | 3.48                         |
| May           | 3.57                 | 2.85                         | 4.39                         |
| June          | 4.29                 | 3.46                         | 5.13                         |
| July          | 3.99                 | 3.28                         | 4.97                         |
| August        | 4.04                 | 3.51                         | 4.99                         |
| September     | 3.04                 | 2.40                         | 3.73                         |
| October       | 2.38                 | 1.49                         | 3.28                         |
| November      | 1.92                 | 1.46                         | 2.48                         |
| December      | 1.06                 | 0.53                         | 1.32                         |
| <b>Annual</b> | <b>30.60</b>         | <b>28.26</b>                 | <b>34.11</b>                 |
|               |                      |                              |                              |

## Storm Size and Intensity

The size of a storm can be described by the total amount of precipitation, the intensity of the precipitation (amount per time period), and how often this type of storm is expected to occur (frequency). Thus, a 10-year, 24-hour storm can be thought of as a storm with a 10% chance of occurrence in any given year, producing a given amount of rain in 24 hours. A rainfall intensity of 1.5 inches per hour can be expected to occur once every 3 years and has an annual probability of 33%.

# Precipitation

| Frequency (Yrs) | Yearly Probability (%) | 30 Min (in) | 1-Hr (in) | 2-Hr (in) | 6-Hr (in) | 12-Hr (in) | 24-Hr (in) | Atlas 14: 24-Hour (in) | 10-Day (in) |
|-----------------|------------------------|-------------|-----------|-----------|-----------|------------|------------|------------------------|-------------|
| 1 Year          | 99%                    | 0.9         | 1.15      | 1.4       | 1.65      | 1.95       | 2.3        |                        | 3.8         |

## *Snowfall*

The first measurable snowfall typically occurs in the middle of October (1 year in 10), and the last mid-April or later (3 years in 10). The annual snowfall average is 43.2 inches. Since 1932, annual snowfall has ranged from 5.4 inches (1958 - 59) to 81.6 inches (1950 - 1951). An average of four major snowstorms occur each winter.

| Month     | Snow days: (1" or More) | Average depth (in): |
|-----------|-------------------------|---------------------|
| January   | 27                      | 10.4                |
| February  | 25                      | 11.3                |
| March     | 20                      | 10.2                |
| April     | 3                       | 2.4                 |
| May       | -                       | -                   |
| June      | -                       | -                   |
| July      | -                       | -                   |
| August    | -                       | -                   |

| December  | 23                      | 6.9                 |

# Precipitation

## Trends in Precipitation

## Implications of Changes in Precipitation

There are three implications for the changes in precipitation observed within the Coon Creek Watershed if these trends continue through 2023:

**Less Rainfall** If trends continue to 2023 there will be 5% less annual precipitation by that year (An annual average of

# Precipitation

approximately 28.5 inches).

**Less Effective Precipitation** If the probability of larger events continues to increase, the amount of precipitation that infiltrates will decrease.

**Less Infiltration** Less naturally-occurring infiltration.

## Atlas 14

### Management Needs

**Retention** Capture and Retain maximum amount of precipitation.

Break up routing of stormwater to maximize retention and detention to benefit water quality, flood control, habitat and water supply.

**Infiltration** Adopt 'treatment train' approach to the management and retention of water.
